Panikhaiti, Guwahati-781026
Assam, India**

Session : February – June, 2023

**A PROJECT REPORT
SUBMITTED TO
ASSAM DOWN TOWN UNIVERSITY
FOR PARTIAL FULFILLMENT OF THE REQUIREMENTS
FOR THE SIXTH SEMESTER OF BACHELOR OF
TECHNOLOGY (CLOUD COMPUTING AND INFORMATION
SECURITY**

**Bachelor of Technology (Cloud Computing and
Information Security)
Faculty of Engineering
Assam Down Town University**
Gandhi Nagar, Panikhaiti, Guwahati- 781026, Assam

DECLARATION

I, **Sakib Rahman** bearing Registration No. **ADTU/2020-24/BTech(CTIS)/001** and **Simran Malakar** bearing Registration No. **ADTU/2020-24/BTech(CTIS)/011**, hereby declare that the work embodied in this thesis under the title "***A Web Based Efficient Content Management System***" is an original work carried out in the Faculty Of Engineering, **Assam Down Town University**, Guwahati with exception of guidance and suggestions received from my supervisor, **Mr, Kishore Medhi** Assistant Professor, Computer Science & Engineering, Assam Down Town University, Guwahati. The data and the findings discussed in the thesis are the outcome of my research work. This thesis is being submitted to Assam Downtown University for the degree of Bachelor of Technology (Cloud Technology and Information Security).

Date:

Place: Guwahati

**Bachelor of Technology (Cloud Computing and
Information Security)
Faculty of Engineering
Assam down town University
Panikhaiti, Guwahati - 781026, Assam**

CERTIFICATE FROM GUIDE

This is to certify that the work contained in the thesis entitled "**A Web Based Efficient Content Management System**", submitted by **Sakib Rahman** bearing Registration No. **ADTU/2020-24/BTech(CTIS)/001**, and **Simran Malakar** bearing Registration No. **ADTU/2020-24/BTech(CTIS)/011** for the award of the degree of **Bachelor of Technology in Cloud Technology and Information Security** to **Assam Downtown University** is a record of bonafide project works carried out by him and her under my direct supervision and guidance.

I considered that the thesis has reached the standards and fulfilling the requirements of the rules and regulations relating to the nature of the degree. The contents embodied in the thesis have not been submitted for the award of any other degree or diploma in this or any other university.

Date:
Place: Guwahati

Mr. Kishore Medhi
Assistant Professor, Faculty of Computer Technology
Assam Downtown University
Guwahati - 781026

ACKNOWLEDGMENT

We would like to express our deepest gratitude and appreciation to all those who have contributed to the completion of my CMS mini-project and the subsequent writing of this thesis.

First and foremost, We would like to thank our supervisor, Mr Kishore Medhi, for their guidance, expertise, and invaluable support throughout this project. Their insightful suggestions, constructive feedback, and continuous encouragement have been instrumental in shaping this work.

We are thankful to the college administration for providing us with the resources and facilities required for this project. The availability of library resources, computer labs, and online databases has been instrumental in conducting research and gathering relevant information. We are also grateful to the technical support staff for their assistance whenever needed.

Lastly, I would like to thank our friends, and classmates for their unwavering support and understanding. Their encouragement and belief in my abilities have been my motivation throughout this journey. Their presence and companionship have made this project a memorable experience.

Sakib Rahman
ADTU/2020-24/BTech(CTIS)/001

Simran Malakar
ADTU/2020-24/BTech(CTIS)/011

ABSTRACT

This thesis presents the development and evaluation of a web-based efficient content management system (CMS) designed specifically for college environments. The system aims to streamline and enhance the management and dissemination of information within the college ecosystem. The digital transformation of educational institutions necessitates efficient and user-friendly platforms for managing and sharing information. The proposed system aims to address these challenges by providing a centralized and intuitive interface for content creation, organization, and distribution. The development of the web-based efficient CMS involved extensive research, analysis, and iterative design processes. The system offers a comprehensive set of features, including user management, content creation and editing, document sharing, event management, and announcement broadcasting. It incorporates modern web technologies and responsive design principles to ensure compatibility across various devices and browsers. The web-based efficient CMS developed for this college mini project presents a significant advancement in managing college-related information. The system's user-friendly interface and comprehensive feature set empower users to create, organize, and distribute content effortlessly. By streamlining content management processes, the system enables administrators, faculty, and students to focus on their core responsibilities while ensuring timely and accurate information dissemination.

1. Introduction

In the age of digitalization, the demand for managing digital content has increased significantly. The Content Management System (CMS) is one of the most popular tools used to manage digital content. CMS allows users to create, edit, and publish digital content on various platforms with ease. CMS is widely used in various fields like digital marketing, e-commerce, news websites, and blogs. This mini project aims to develop a CMS in which college administrators, professors, and students can easily create and publish content, while also ensuring that it is organized, searchable, and easily accessible. Additionally, a CMS can help maintain consistency in the branding and messaging of the college, while also allowing for collaboration among different content creators. Overall, a CMS can be an essential tool for managing the complex and diverse content needs of a modern college.

1.1 Overview of the project

The CMS mini project aims to develop a Content Management System (CMS) specifically designed for college administrators, professors, and students. The project focuses on providing an efficient and user-friendly solution for creating, editing, and publishing digital content within the college environment. The CMS will facilitate the organization, searchability, and accessibility of content, ensuring a streamlined content management process.

By utilizing modern web technologies such as HTML, CSS, JavaScript, and PHP, the project will develop a robust CMS with a responsive and intuitive user interface. The Model-View-Controller (MVC) architecture will be implemented to separate the application's concerns and enhance manageability.

The primary goal of the project is to address the complex and diverse content management needs of a modern college. The CMS will allow college administrators to efficiently manage and publish content related to events, announcements, and administrative information. Professors will be able to create and share course materials, lecture notes, and assignments with students. Students, on the other hand, can contribute to blogs, forums, and discussion boards, fostering collaboration and knowledge sharing within the college community.

The CMS will incorporate essential features such as search functionality, categorization, and tagging, enabling users to easily discover and retrieve content. It will also include version control capabilities, allowing users to track and revert to previous versions of content if needed.

The project's scope encompasses the development of a comprehensive CMS that caters specifically to the content management needs of colleges. By providing an efficient and user-friendly platform, the CMS mini project aims to enhance productivity, collaboration, and content consistency within the college environment.

1.2 Motivation

The motivation behind the CMS mini project stems from the increasing demand for effective content management solutions in the digital age, specifically within the college setting. Several factors drive the need for a dedicated content management system tailored for colleges.

Firstly, colleges face the challenge of managing a vast amount of digital content across multiple platforms and channels. From administrative announcements and event promotions to course materials and student-generated content, colleges need a centralized system to streamline content creation, editing, and publishing processes.

Secondly, traditional manual methods of content management can be time-consuming, inefficient, and prone to errors. Manually updating websites, handling paper-based documentation, or relying on disparate systems hinder the college's ability to keep content up-to-date, consistent, and easily accessible.

Thirdly, collaboration among different stakeholders within the college community is crucial. Professors need to share course materials with students, administrators need to publish information relevant to various departments, and students need platforms for engagement and knowledge exchange. A CMS can facilitate collaboration by providing a unified platform where all users can contribute, access, and interact with digital content.

Moreover, branding consistency and effective communication are essential for colleges. A CMS allows administrators to maintain a cohesive brand identity across different content channels, ensuring a professional and unified online presence. It enables efficient content delivery to students, faculty, and other stakeholders, fostering effective communication and engagement.

The rising significance of digital marketing in the education sector further underscores the need for a CMS in colleges. Digital marketing strategies require managing content across various platforms, such as websites, social media, and email campaigns, to attract prospective students and engage with the college community. A CMS can streamline content management, provide analytics on content performance, and enable targeted content distribution.

1.3 Scope & Objective

The scope of the CMS mini project revolves around developing a comprehensive Content Management System (CMS) tailored specifically for the content management needs of colleges. The project aims to provide a user-friendly and efficient platform for college administrators, professors, and students to create, edit, and publish digital content within the college environment.

The primary objective of the project is to streamline the content management process in colleges by offering a centralized system that enhances productivity, collaboration, and content consistency. The CMS will encompass various features and functionalities to achieve this objective, including:

- 1. Content Creation and Editing:** The CMS will provide intuitive interfaces for college administrators, professors, and students to easily create and edit digital content. This includes support for text-based content, multimedia elements, document uploads, and formatting options.
- 2. Content Organization and Categorization:** The CMS will facilitate the organization of content by providing a taxonomy or hierarchical classification system. This will allow users to categorize content into different sections, departments, courses, or any relevant classification scheme specific to the college's needs.

3. **Content Publishing and Distribution:** The CMS will enable users to publish content on various platforms such as websites, social media, or internal portals. It will provide options for scheduling content publication, setting access permissions, and managing content visibility.
4. **Search and Retrieval:** The CMS will incorporate search functionality to allow users to easily find specific content within the system. This includes keyword-based search, advanced filtering options, and relevant search results presentation.
5. **Collaboration and User Management:** The CMS will support collaboration among different users within the college community. It will enable content sharing, version control, and user roles and permissions management to ensure appropriate access and contribution levels.
6. **Branding and Customization:** The CMS will provide customization options to maintain the college's branding and visual identity across various content channels. This includes customizable templates, themes, and style options.

The scope also includes the development of the CMS using modern web technologies such as HTML, CSS, JavaScript, and PHP. The project will adhere to the Model-View-Controller (MVC) architecture to ensure separation of concerns and maintainability.

1.4 Existing System

Content Management Systems (CMS) have evolved over the years to provide powerful tools for website creation, management, and administration. As of my knowledge cutoff in September 2021, several popular CMS platforms exist, each with its own features and capabilities.

Here are some examples:

1. **WordPress:** WordPress is one of the most widely used CMS platforms, powering over 40% of all websites on the internet. It offers a user-friendly interface, a vast library of themes and plugins, and extensive customization options. WordPress supports various types of websites, from blogs and small business sites to large e-commerce stores.
2. **Joomla:** Joomla is another popular CMS that is known for its flexibility and scalability. It offers a range of features for building websites, including content publishing, user management, SEO optimization, and e-commerce functionality. Joomla has a robust extension marketplace where users can find additional modules and templates to enhance their websites.
3. **Drupal:** Drupal is a powerful CMS that is favored by developers and large organizations. It provides a highly customizable platform for building complex websites and web applications. Drupal offers advanced content management features, multilingual support, and a strong security framework. It is often used for enterprise-level websites, government portals, and community-driven platforms.
4. **Magento:** While primarily focused on e-commerce, Magento is a CMS specifically designed for building online stores. It offers a rich set of features for product catalog

management, order processing, payment integration, and customer engagement. Magento provides scalability and customization options to accommodate the needs of small businesses as well as large enterprises.

5. **Shopify:** Shopify is a cloud-based CMS that simplifies the process of creating and managing online stores. It provides an intuitive interface, pre-designed templates, and built-in tools for inventory management, payment processing, and marketing. Shopify is popular among small and medium-sized businesses looking for a user-friendly e-commerce solution.

These are just a few examples of existing CMS platforms. Each CMS has its own strengths and weaknesses, and the choice of a CMS depends on the specific requirements and goals of a website or web application. It's worth noting that new CMS platforms may have emerged since my knowledge cutoff, and it's always advisable to research and evaluate the latest options available.

1.5 Problem Definition

The problem addressed by the CMS mini project is the inefficiency and limitations of the existing content management systems or processes in colleges. These limitations hinder effective content creation, editing, organization, and distribution, leading to challenges in managing and publishing digital content within the college environment. The following are the key problems addressed by the project:

1. **Lack of Centralization:** Colleges often lack a centralized content management system, resulting in scattered content across various platforms and channels. This leads to difficulties in maintaining consistency, updating content, and ensuring easy accessibility for users.
2. **Manual and Time-Consuming Processes:** Many colleges still rely on manual processes for content management, such as physically updating notice boards or distributing printed materials. These manual processes are time-consuming, error-prone, and do not support efficient content updates or collaboration.
3. **Limited Collaboration and Knowledge Sharing:** The existing systems may not provide collaboration features that enable seamless knowledge sharing and content collaboration among college administrators, professors, and students. This limitation hampers effective communication, collaboration, and content contribution within the college community.
4. **Inefficient Search and Retrieval:** Locating specific content within the existing systems can be challenging due to limited search capabilities, inadequate categorization, and lack of advanced filtering options. This inefficiency hampers content discovery and retrieval, leading to time wastage and frustration for users seeking information.
5. **Content Inconsistency and Branding Challenges:** In the absence of a centralized system, maintaining content consistency and branding across multiple platforms becomes difficult. Different departments or individuals may have varying approaches to content creation and publishing, resulting in inconsistencies in formatting, style, and messaging.

6. **Limited Analytics and Optimization:** Without a dedicated CMS, colleges face challenges in gathering data and insights on content performance. Lack of analytics and optimization capabilities restricts the ability to track content engagement, user behavior, and make data-driven decisions to improve content strategies.

The CMS mini project aims to address these problems by developing a comprehensive CMS solution that centralizes content management, enhances collaboration, improves searchability, ensures content consistency, and provides analytics for data-driven optimization. By addressing these challenges, the project aims to streamline the content management process in colleges and provide a more efficient and user-friendly platform for content creation, editing, and publishing.

1.6 Proposed System

The proposed system is a comprehensive Content Management System (CMS) designed to cater to the specific content management needs of colleges. The CMS mini project aims to provide a user-friendly and efficient platform for college administrators, professors, and students to create, edit, and publish digital content within the college environment.

Key features and functionalities of the proposed system include:

1. **User Management:** The CMS will have a user management module that allows administrators to create and manage user accounts with different roles and permissions. This ensures that only authorized users can access and contribute to the content.
2. **Content Creation and Editing:** The CMS will provide an intuitive interface for users to create and edit content. It will support various content types such as text, images, videos, and documents. Users will have formatting options, spell-checking, and media embedding capabilities to enhance their content.
3. **Content Organization and Categorization:** The CMS will allow users to organize content into categories and subcategories. It will provide a taxonomy or hierarchical classification system to facilitate easy content discovery and navigation. Users can assign tags and metadata to content for better organization and searchability.
4. **Content Publishing and Scheduling:** The CMS will enable users to publish content on various platforms such as websites, blogs, and social media channels. It will provide options to schedule content publication, allowing users to plan and automate content releases. Users can preview content before publishing to ensure accuracy and consistency.
5. **Search and Retrieval:** The CMS will incorporate a robust search functionality to enable users to search for specific content within the system. It will support keyword-based search, advanced filtering options, and sorting capabilities for efficient content retrieval.
6. **Version Control:** The CMS will include a version control system to track changes made to content. It will maintain a history of revisions, allowing users to revert to previous versions if needed. This feature ensures content integrity and facilitates collaboration among multiple content creators.

7. **Collaboration and Workflow Management:** The CMS will provide collaboration features that enable users to work together on content creation and editing. It will support features like content review, comments, and task assignment, streamlining the content production process and ensuring efficient collaboration.
8. **Analytics and Reporting:** The CMS will include analytics and reporting capabilities to provide insights into content performance, user engagement, and audience behavior. Administrators can track key metrics, generate reports, and make data-driven decisions to optimize content strategies.

The proposed system will be developed using modern web technologies such as HTML, CSS, JavaScript, and PHP. The Model-View-Controller (MVC) architecture will be employed to ensure modularity, code reusability, and ease of maintenance.

1. Project Analysis

2.1 Project Requirements Analysis

The project requirements analysis phase is a crucial step in understanding and documenting the specific needs and expectations of the stakeholders. It involves gathering, analyzing, and documenting the requirements that will drive the development of the Content Management System (CMS) mini project. The requirements analysis ensures that the project meets the functional, non-functional, and technical requirements of the intended users.

During the project requirements analysis, the following activities are performed:

1. **Stakeholder Identification:** The stakeholders, including college administrators, professors, and students, are identified. Their roles, responsibilities, and needs regarding content management are documented.
2. **Requirement Elicitation:** Various techniques such as interviews, surveys, and workshops are employed to elicit requirements from the stakeholders. The requirements are gathered by discussing their pain points, expectations, and desired functionalities of the CMS.
3. **Requirement Documentation:** The elicited requirements are documented systematically using tools like use cases, user stories, and requirement specification documents. This documentation captures the functional requirements that outline what the CMS should do and the non-functional requirements that specify the system's performance, security, and usability criteria.
4. **Requirement Prioritization:** The documented requirements are prioritized based on their importance and urgency. This helps in determining the critical features that need to be developed first and sets the project roadmap accordingly.
5. **Requirement Validation:** The documented requirements are validated with the stakeholders to ensure accuracy, completeness, and feasibility. Feedback is sought, and necessary modifications are made to align the requirements with the stakeholders' expectations.
6. **Requirement Traceability:** A traceability matrix is created to establish a relationship between the requirements and the corresponding system components or functionalities. This helps in tracking the progress of requirement implementation during the development phase.

The project requirements analysis phase aims to capture a clear and comprehensive understanding of the stakeholders' needs and expectations for the CMS mini project. It lays the foundation for the subsequent stages of design, development, and testing by providing a solid basis for decision-making and solution development.

2.1 Gantt Chart

A Gantt chart is a visual representation of project tasks and their corresponding timelines. It is an essential tool used in project management to plan, schedule, and track the progress of tasks throughout the project's lifecycle. The Gantt chart provides a clear overview of project activities, their dependencies, durations, and milestones.

In the context of the CMS mini project, a Gantt chart can be created to outline the various tasks and their scheduled durations. It helps in visualizing the project timeline and identifying critical paths, ensuring that the project stays on track and meets the specified deadlines.

Here is an example of how a Gantt chart for the CMS mini project may look:

Task Name	2023					
	Jan	Feb	Mar	Apr	May	Jun
Planning						
Research						
Requirement Gathering						
Design						
Technology Selection						
Development						
Testing						
Documentation						

In the above example, each task is listed along with its estimated duration in weeks. The Gantt chart provides a visual representation of the project timeline, allowing project managers and stakeholders to see how tasks are sequenced and determine their dependencies.

By utilizing a Gantt chart, the project team can monitor the progress of each task, identify potential bottlenecks or delays, and take appropriate measures to keep the project on schedule. It also helps in resource allocation, as team members can see their tasks and deadlines, enabling effective time management and workload distribution.

It is important to note that the Gantt chart is a dynamic tool that may require updates and adjustments throughout the project as new information becomes available or changes occur. Regular monitoring and maintenance of the Gantt chart ensure that the project stays aligned with the planned timeline and milestones.

2.3 Advantage & Disadvantage

Advantage of CMS Mini Project:

1. **Efficient Content Management:** The CMS mini project provides an efficient way to manage digital content. It allows users, such as college administrators, professors, and students, to easily create, edit, and publish content across various platforms. This streamlines the content management process, saving time and effort.
2. **Centralized Control:** With the CMS mini project, content management can be centralized, allowing for consistent branding and messaging across all digital platforms. College administrators can ensure that content meets the desired standards and guidelines, maintaining a cohesive and professional online presence.
3. **Collaboration and Workflow:** The CMS mini project facilitates collaboration among content creators. Multiple users can work on the same content simultaneously, making it easier to manage and update content collaboratively. This enhances productivity and enables efficient workflow management.
4. **Organization and Searchability:** The CMS mini project enables content organization through features such as categorization, tagging, and metadata. This makes it easier to search and retrieve content, improving content discoverability and user experience.

Disadvantage of CMS Mini Project:

1. **Learning Curve:** Implementing and using a CMS mini project may require a learning curve for users who are unfamiliar with the system. Training and support may be necessary to ensure smooth adoption and utilization of the CMS by college administrators, professors, and students.
2. **Customization Limitations:** Off-the-shelf CMS solutions, including the CMS mini project, may have limitations in terms of customization. While they offer a range of features, specific customization requirements may not be easily accommodated without additional development efforts or customization options.
3. **Technical Dependencies:** The CMS mini project relies on underlying technologies such as HTML, CSS, JavaScript, and PHP. Any changes or updates to these technologies may impact the functionality or compatibility of the CMS. Regular maintenance and updates are required to ensure smooth operation.
4. **Security Concerns:** As a digital content management system, the CMS mini project needs to address security concerns related to user authentication, data privacy, and protection against potential vulnerabilities. Robust security measures must be implemented to safeguard sensitive data and mitigate potential risks.

It is important to note that the advantages and disadvantages of the CMS mini project may vary based on specific project requirements, implementation choices, and user needs. Careful consideration of these factors will help ensure that the CMS mini project meets the desired objectives while addressing any potential challenges.

2.4 Project Life Cycle

The project life cycle refers to the series of phases or stages that a project goes through from its initiation to its closure. Each phase in the project life cycle represents a distinct set of activities and deliverables that contribute to the successful completion of the project. The specific stages may vary depending on the project management methodology used, but here is a general overview of the typical project life cycle for the CMS mini project:

1. Initiation Phase:

- This phase involves identifying the need for the CMS mini project and determining its feasibility.
- The project's goals, objectives, and scope are defined, and the stakeholders' requirements are analyzed.
- A project charter or initiation document is created to formally initiate the project.

2. Planning Phase:

- In this phase, the project plan is developed, which includes defining project tasks, resources, and schedules.
- Project milestones and deliverables are identified, and a Gantt chart or other project scheduling tools are created.
- The project team is established, and roles and responsibilities are assigned.
- Risks and constraints are identified and addressed through risk management strategies.

3. Execution Phase:

- This phase involves the actual development and implementation of the CMS mini project.
- The project team works on designing and developing the CMS system according to the defined requirements and specifications.
- Content creation, database setup, user interface design, and system integration are some of the key activities during this phase.
- Regular communication and coordination among team members are maintained to ensure progress and address any issues or challenges.

4. Monitoring and Control Phase:

- In this phase, the project progress is monitored, and project activities are controlled to ensure they are on track.
- Key performance indicators (KPIs) are established to measure and evaluate the project's performance.
- Project managers conduct regular status meetings, track project metrics, and manage project risks and issues.
- Adjustments and corrective actions are implemented as necessary to keep the project on schedule and within budget.

5. Testing and Quality Assurance Phase:

- This phase focuses on testing the CMS system to ensure its functionality, usability, and performance.
- Test cases are created, and various testing techniques, such as unit testing, integration testing, and user acceptance testing, are performed.
- Bugs and issues are identified, tracked, and resolved to ensure the CMS meets the desired quality standards.

6. Deployment and Implementation Phase:

- In this phase, the CMS system is deployed and implemented in the production environment.
- Data migration, system configuration, and user training may be conducted during this phase.
- The system is made available to the intended users, such as college administrators, professors, and students.

7. Closure Phase:

- The closure phase involves the finalization and handover of the CMS mini project.
- Project deliverables are reviewed, and project performance is assessed against the initial objectives and requirements.
- Lessons learned are documented to inform future projects, and a project closure report is created.
- The project is officially closed, and necessary documentation and knowledge transfer take place.

It is important to note that the project life cycle is not always linear, and iterations or overlapping phases may occur depending on the project's specific needs and circumstances. Effective project management practices and techniques are essential throughout the entire project life cycle to ensure successful completion of the CMS mini project.

2.5 Project Feasibility Study

A feasibility study is conducted to assess the viability and potential success of a project. It evaluates various aspects, including technical feasibility, operational feasibility, economic feasibility, and legal and regulatory feasibility. Here is an overview of the feasibility study for the CMS mini project:

1. Technical Feasibility:

- The technical feasibility assesses whether the proposed CMS mini project can be developed and implemented using the available technologies and resources.
- It examines the compatibility of the selected technologies (HTML, CSS, JavaScript, PHP) with the project requirements.
- The availability of skilled developers and necessary infrastructure is also evaluated to ensure the successful development and maintenance of the CMS system.

2. Operational Feasibility:

- The operational feasibility determines whether the CMS mini project aligns with the operational needs and capabilities of the college administrators, professors, and students.
- It examines whether the CMS system can effectively meet the content management requirements, streamline workflows, and improve operational efficiency.

- The ease of use, training requirements, and acceptance by the end-users are considered to ensure the system's successful adoption and utilization.

3. Economic Feasibility:

- The economic feasibility assesses the financial viability of the CMS mini project.
- It analyzes the estimated costs of development, implementation, and maintenance, comparing them with the potential benefits and returns on investment.
- Factors such as cost savings, improved productivity, and potential revenue generation are considered to determine whether the project is economically feasible.

4. Legal and Regulatory Feasibility:

- The legal and regulatory feasibility evaluates whether the CMS mini project complies with applicable laws, regulations, and industry standards.
- It assesses any legal restrictions, copyright issues, data protection and privacy requirements, and security considerations related to the project.
- Compliance with relevant laws and regulations is crucial to avoid legal risks and ensure the integrity and security of the CMS system and its content.

The feasibility study helps project stakeholders make informed decisions about proceeding with the CMS mini project. It identifies potential risks, challenges, and constraints that may impact project success and provides recommendations to mitigate those risks. The study's findings and recommendations serve as a basis for determining whether to proceed with the project, make modifications, or explore alternative solutions.

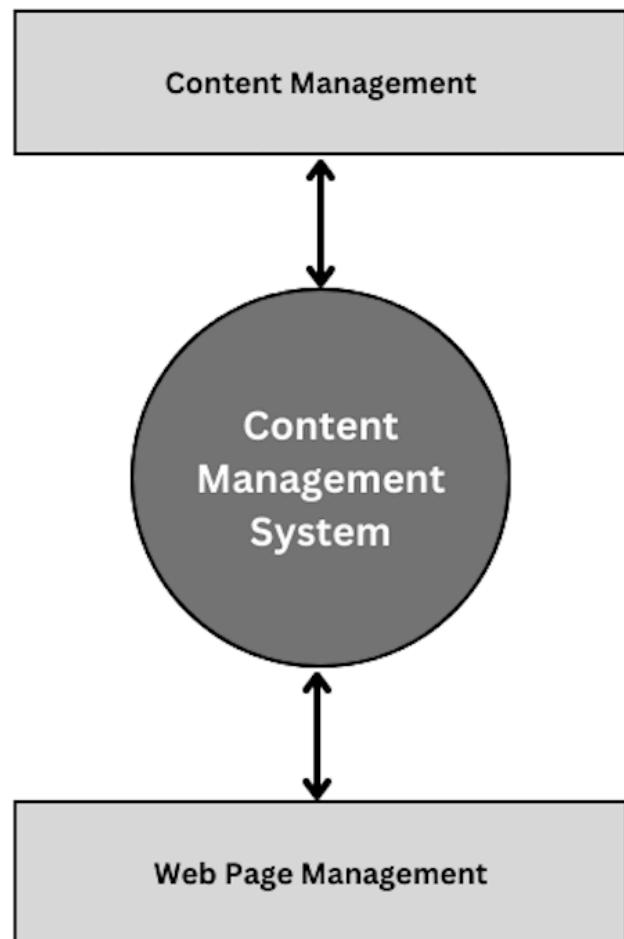

It is important to conduct a comprehensive feasibility study to ensure that the CMS mini project is not only technically feasible but also operationally, economically, and legally viable. This helps minimize risks, maximize the project's chances of success, and align the project's goals with the stakeholders' needs and expectations.

2. Project Design

3.1 DFD (Data Flow Diagram)

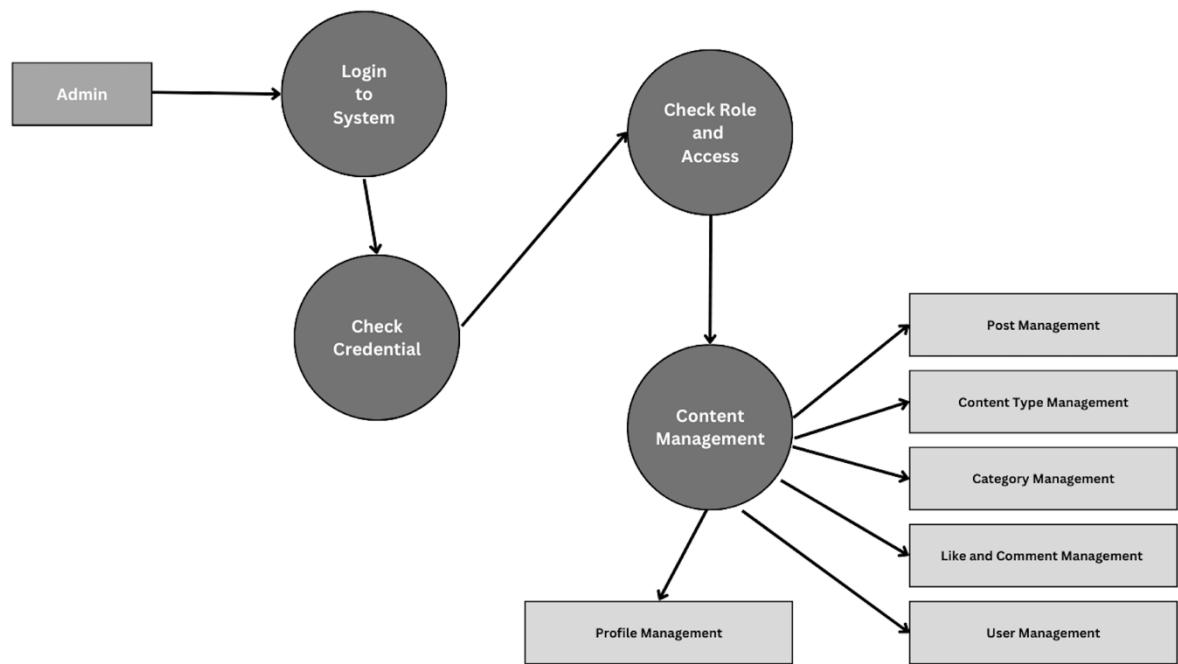

A Data Flow Diagram (DFD) is a graphical representation that illustrates the flow of data within a system. It provides a clear visual depiction of how data moves through different processes and entities in the system.

Zero Level Data Flow Diagram (0 Level DFD) of CMS

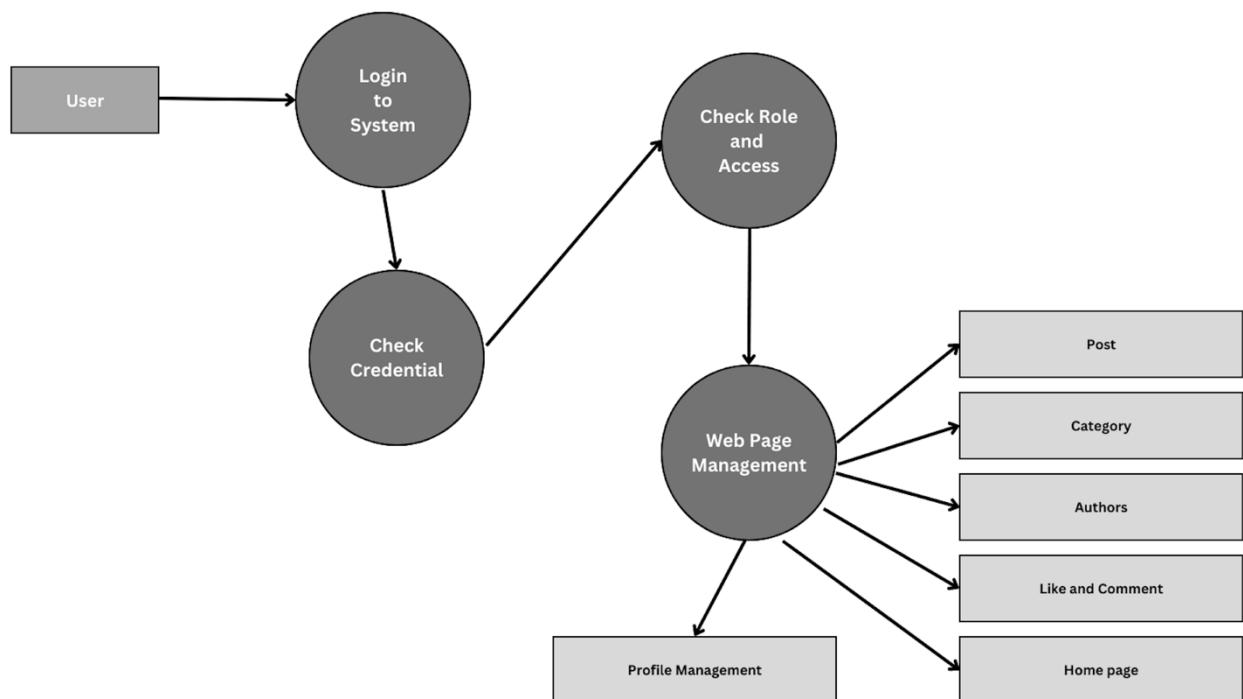

Zero Level DFD

First Level Data Diagram (1st Level DFD) of CMS

First Level DFD - 1

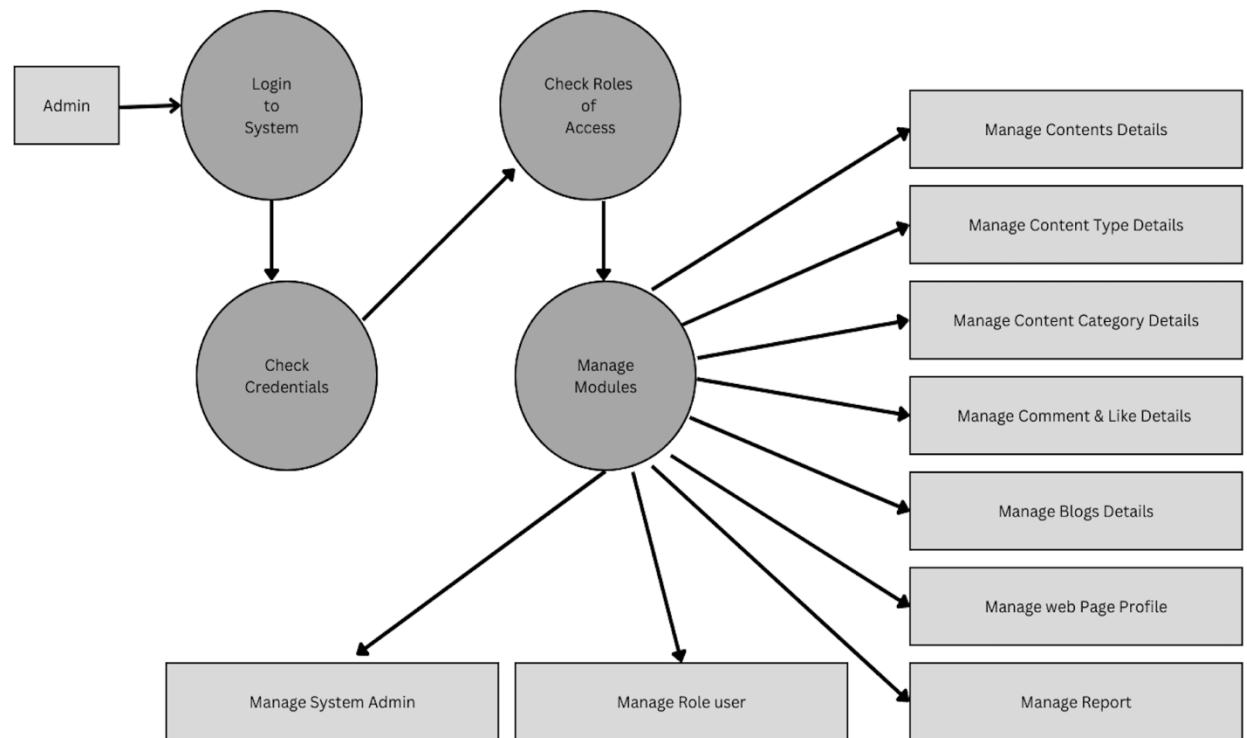

First Level DFD - 2

Second Level Data Flow Diagram (2nd Level DFD) of CMS

Low Level Functionalities of CMS

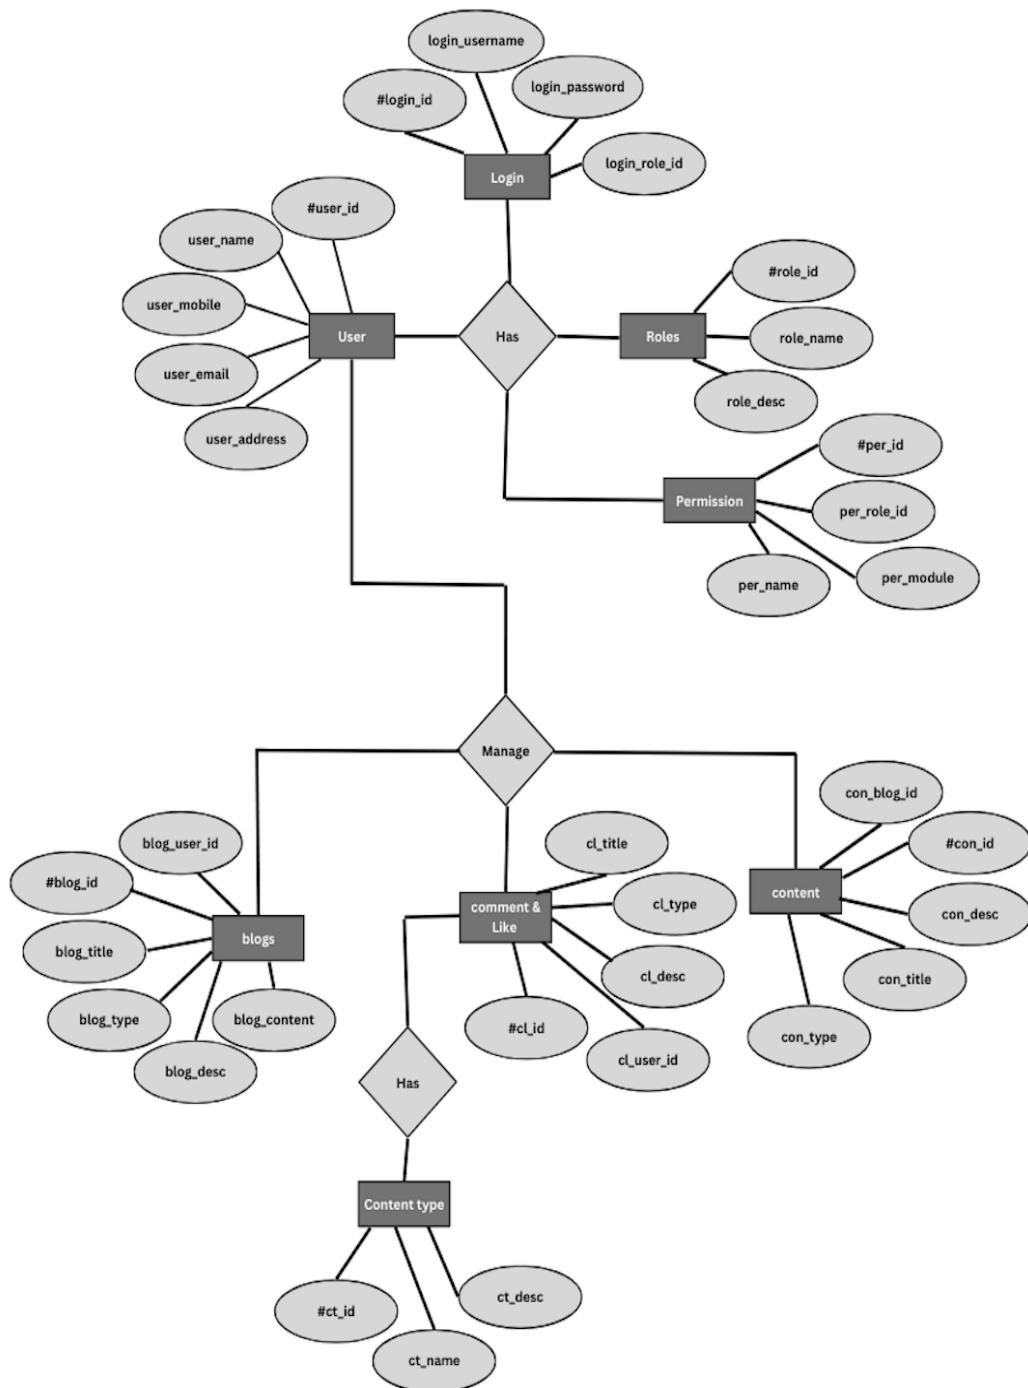

- Admin login to the system and manage all the functionalities of content Management System
- Admin can add, edit, delete and view the records of content, content category, Blogs, Login
- Admin can manage all the details of content type, comment, like, web page
- Admin can also generate reports of content, content type, content category, comment, like, blogs, web page
- Admin can search the details of content type, blogs, web page
- Admin can apply different level of filters on report of content, comment, blogs
- Admin can tracks the details information of the content type, content category, comment, like and blogs

Second Level DFD

3.2 ER Diagram

An Entity-Relationship (ER) diagram is a visual representation of the entities, relationships, and attributes within a system. It helps in modeling the data structure and relationships between different entities.

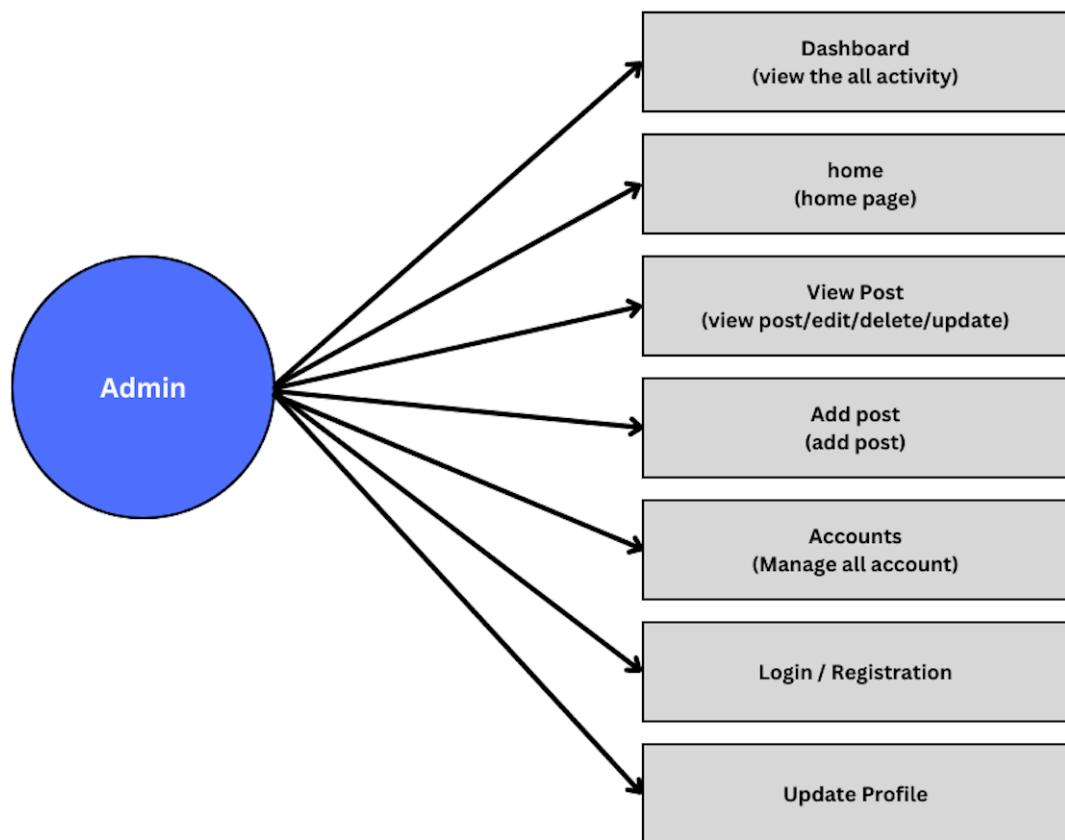

ER Diagram

3.3 Use Case Diagram

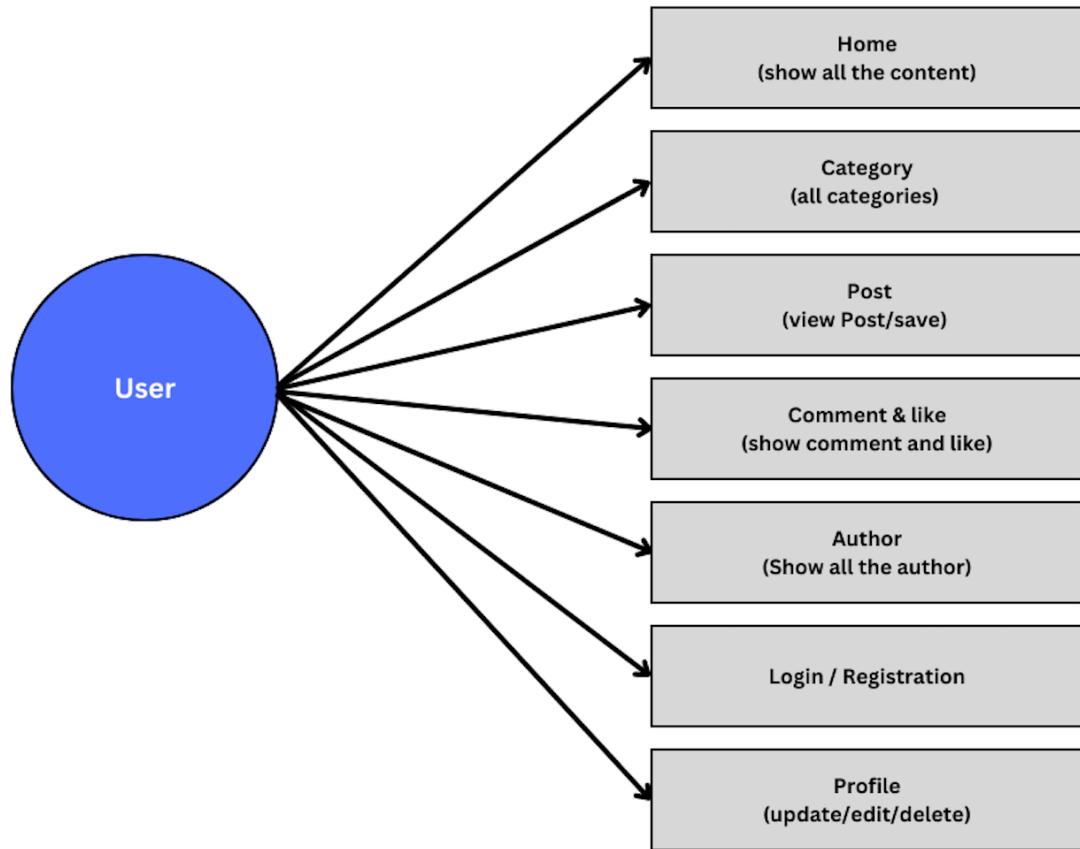

A Use Case Diagram is a visual representation that illustrates the interactions between actors (users or external systems) and the system under consideration. It helps in understanding the functionalities and behaviors of the system from a user's perspective.

Use Case Diagrams Admin

Use case Diagram - 1

Use Case Diagrams User

Use case Diagram - 2

3. Database Design

Database design is a crucial aspect of any project that involves data storage and management. It involves structuring the database schema, defining tables, specifying relationships between tables, and determining attributes and data types.

Here is a general overview of the Database of the CMS

1. Database Table

The screenshot shows the MySQL Workbench interface with the following details:

- Server:** localhost
- Database:** blog_db
- Table List:**
 - admin (2 rows)
 - comments (1 row)
 - likes (3 rows)
 - posts (3 rows)
 - users (2 rows)
 - 5 tables Sum**
- Row Statistics:** 11 rows, InnoDB engine, utf8mb4_general_ci collation, 96.0 Kib size, 0 B overhead.

2. Admin Table

The screenshot shows the MySQL Workbench interface for the admin table:

- Table Structure:**

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
1	id	int(100)	utf8mb4_general_ci		No	None	AUTO_INCREMENT		Change Drop More
2	name	varchar(20)	utf8mb4_general_ci		No	None			Change Drop More
3	password	varchar(50)	utf8mb4_general_ci		No	None			Change Drop More
- Action Buttons:** Browse, Insert, Export, Import, Privileges, Operations, Tracking, Triggers.
- Central Column Options:** Check all, With selected, Add to central columns, Remove from central columns.
- Bottom Navigation:** Print, Propose table structure, Track table, Move columns, Normalise.
- Index Management:** Add index (1 column(s), after password), Go button.
- Index Details:** Action, Keyname, Type, Unique, Packed, Column, Cardinality, Collation, Null, Comment.
- Create Index:** Create an index on 1 columns, Go button.

3. Comments Table

The screenshot shows the MySQL Workbench interface for the 'comments' table in the 'blog_db' database. The table has seven columns:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
1	id	int(100)			No	None		AUTO_INCREMENT	Change Drop More
2	post_id	int(100)			No	None			Change Drop More
3	admin_id	int(100)			No	None			Change Drop More
4	user_id	int(100)			No	None			Change Drop More
5	user_name	varchar(50)	utf8mb4_general_ci		No	None			Change Drop More
6	comment	varchar(1000)	utf8mb4_general_ci		No	None			Change Drop More
7	date	date			No	current_timestamp()			Change Drop More

Below the table structure, there are buttons for Print, Propose table structure, Track table, Move columns, Normalise, Add, and Go. An 'Indexes' tab is also present, showing one primary key index:

Action	Keyname	Type	Unique	Packed	Column	Cardinality	Collation	Null	Comment
Edit Rename Drop	PRIMARY	BTREE	Yes	No	id	0	A	No	

4. Like Table

The screenshot shows the MySQL Workbench interface for the 'likes' table in the 'blog_db' database. The table has four columns:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
1	id	int(100)			No	None		AUTO_INCREMENT	Change Drop More
2	user_id	int(100)			No	None			Change Drop More
3	admin_id	int(100)			No	None			Change Drop More
4	post_id	int(100)			No	None			Change Drop More

Below the table structure, there are buttons for Print, Propose table structure, Track table, Move columns, Normalise, Add, and Go. An 'Indexes' tab is also present, showing two indexes: a primary key and a unique index on the user_id column:

Action	Keyname	Type	Unique	Packed	Column	Cardinality	Collation	Null	Comment
Edit Rename Drop	PRIMARY	BTREE	Yes	No	id	4	A	No	
Edit Rename Drop	user_id	BTREE	No	No	user_id	4	A	No	

At the bottom, there is a 'Create an index on' button with a dropdown for columns and a 'Go' button.

5. Post Table

The screenshot shows the 'posts' table structure in MySQL Workbench. The table has 9 columns:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
1	id	int(100)	utf8mb4_general_ci		No	None	AUTO_INCREMENT		Change Drop More
2	admin_id	int(100)	utf8mb4_general_ci		No	None			Change Drop More
3	name	varchar(100)	utf8mb4_general_ci		No	None			Change Drop More
4	title	varchar(100)	utf8mb4_general_ci		No	None			Change Drop More
5	content	varchar(10000)	utf8mb4_general_ci		No	None			Change Drop More
6	category	varchar(50)	utf8mb4_general_ci		No	None			Change Drop More
7	image	varchar(100)	utf8mb4_general_ci		No	None			Change Drop More
8	date	date	utf8mb4_general_ci		No	current_timestamp()			Change Drop More
9	status	varchar(10)	utf8mb4_general_ci		No	None			Change Drop More

Below the table, there are buttons for 'Check all', 'With selected:', 'Browse', 'Change', 'Drop', 'Primary', 'Unique', 'Index', 'Spatial', 'Fulltext', and 'Add to central columns'. A 'Remove from central columns' link is also present.

At the bottom, there are links for 'Print', 'Propose table structure', 'Track table', 'Move columns', 'Normalise', and a search bar for 'Add 1 column(s) after status' with a 'Go' button.

Under the 'Indexes' section, there is a table:

Action	Keyname	Type	Unique	Packed	Column	Cardinality	Collation	Null	Comment
Edit Rename Drop	PRIMARY	BTREE	Yes	No	id	3	A	No	

6. User Table

The screenshot shows the 'users' table structure in MySQL Workbench. The table has 4 columns:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
1	id	int(100)	utf8mb4_general_ci		No	None	AUTO_INCREMENT		Change Drop More
2	name	varchar(20)	utf8mb4_general_ci		No	None			Change Drop More
3	email	varchar(50)	utf8mb4_general_ci		No	None			Change Drop More
4	password	varchar(50)	utf8mb4_general_ci		No	None			Change Drop More

Below the table, there are buttons for 'Check all', 'With selected:', 'Browse', 'Change', 'Drop', 'Primary', 'Unique', 'Index', 'Spatial', 'Fulltext', and 'Add to central columns'. A 'Remove from central columns' link is also present.

At the bottom, there are links for 'Print', 'Propose table structure', 'Track table', 'Move columns', 'Normalise', and a search bar for 'Add 1 column(s) after password' with a 'Go' button.

Under the 'Indexes' section, there is a table:

Action	Keyname	Type	Unique	Packed	Column	Cardinality	Collation	Null	Comment
Edit Rename Drop	PRIMARY	BTREE	Yes	No	id	0	A	No	

At the very bottom, there is a link 'Create an index on 1 columns' with a 'Go' button.

4. Project Implementation

5.1 Description of the Software Used

The successful implementation of a project often requires the use of various software tools and technologies. These software tools assist in different aspects of development, testing, and deployment. Here is a description of the software used for the CMS mini project:

1. Integrated Development Environment (IDE):

- An IDE is a software application that provides a comprehensive environment for software development.
- Examples of popular IDEs include Visual Studio Code, IntelliJ IDEA, Eclipse, and NetBeans.
- An IDE offers features like code editing, debugging, version control integration, and project management.

2. Web Technologies:

- HTML, CSS, JavaScript, and PHP are the core web technologies used in the CMS mini project.
- HTML is used for creating the structure and content of web pages.
- CSS is used for styling and formatting the web pages.
- JavaScript adds interactivity and dynamic behavior to the web pages.
- PHP is used for server-side scripting, handling form submissions, and interacting with the database.

3. Database Management System (DBMS):

- A DBMS is software that manages the storage, organization, and retrieval of data in a database.
- Examples of popular DBMSs include MySQL, PostgreSQL, SQLite, and Oracle.
- The chosen DBMS for the CMS mini project will depend on the specific requirements and scalability needs.

4. Local Host Servers:

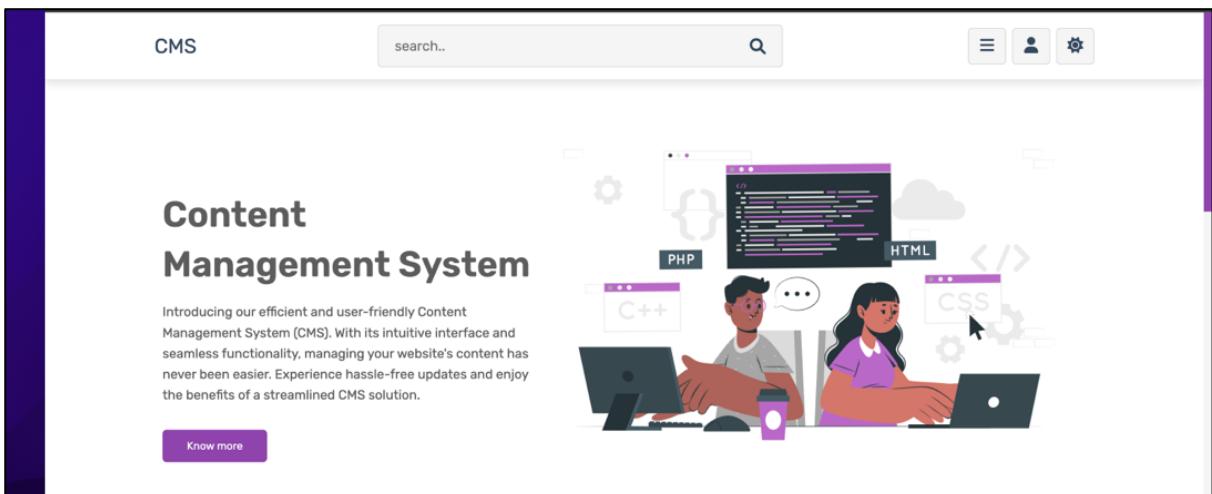

- Xampp
- Apache web server

5.2 Wireframes / UI

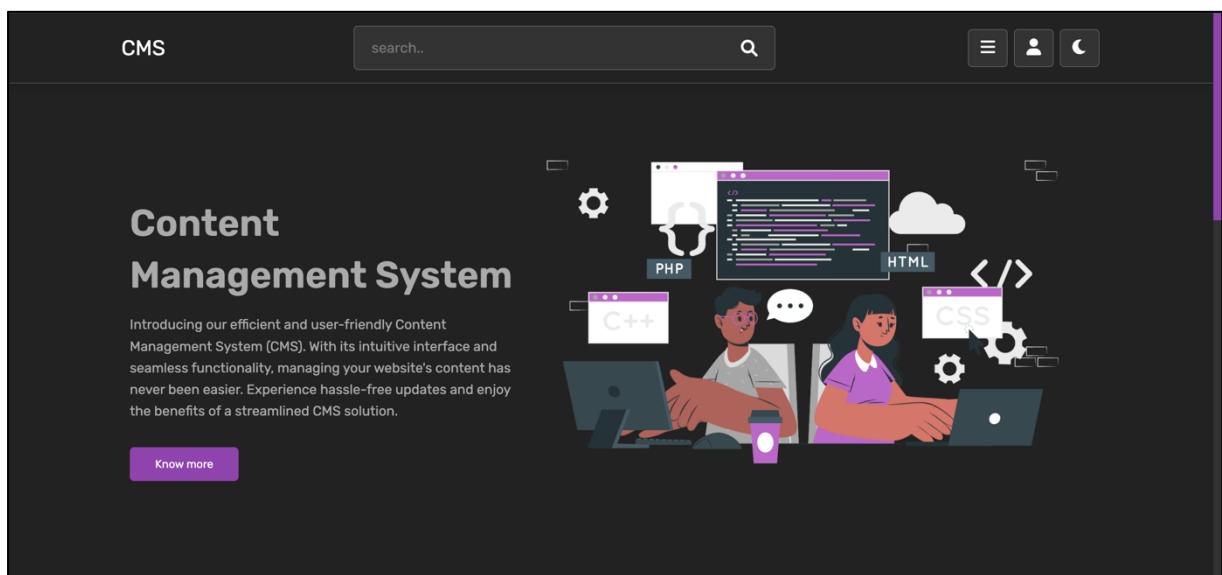

Wireframes and UI (User Interface) designs play a vital role in the visual representation and user experience of a project. They provide a blueprint for the layout, structure, and interactions within the application.

Here is a description of the wireframes and UI designs for the different modules of the CMS mini project:

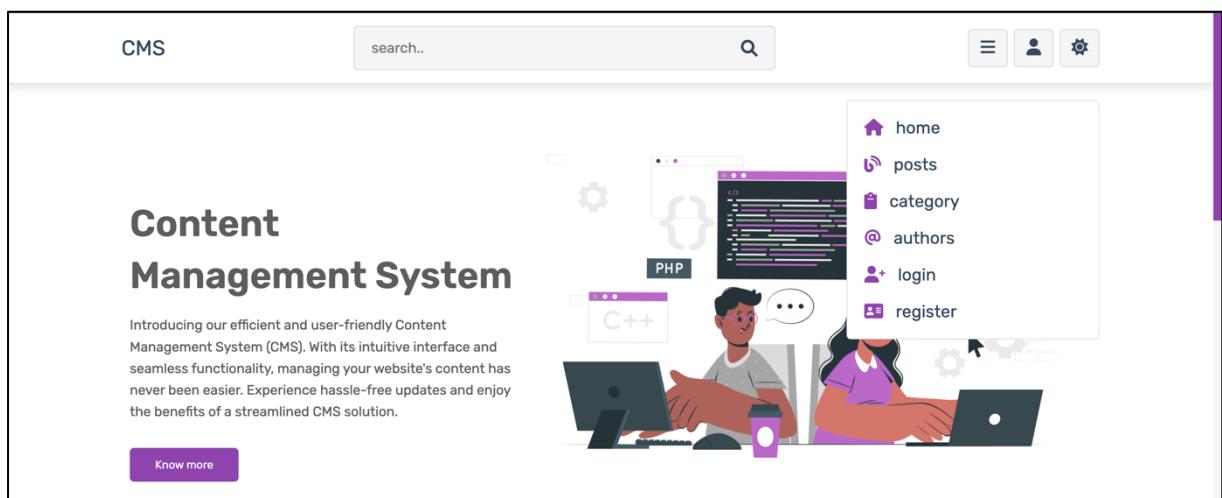

1. User Home page

The screenshot shows a light-themed Content Management System (CMS) home page. At the top, there's a navigation bar with the word "CMS", a search bar containing "search..", and three icons: a menu, a user profile, and settings. The main content area features a large title "Content Management System" with a subtitle below it: "Introducing our efficient and user-friendly Content Management System (CMS). With its intuitive interface and seamless functionality, managing your website's content has never been easier. Experience hassle-free updates and enjoy the benefits of a streamlined CMS solution." A "Know more" button is located at the bottom left of this section. To the right of the text is a colorful illustration of two people working on laptops, surrounded by various tech-related icons like PHP, HTML, CSS, and C++.

The screenshot shows the same CMS home page but in a dark theme. The overall background is black, and the text and icons are white or light-colored. The title "Content Management System" and its subtitle remain the same. The "Know more" button is also present. The central illustration of two people working on laptops with tech icons is visible on the right side.

The screenshot shows the dark-themed CMS home page again, but with a sidebar on the right side. The sidebar contains a list of navigation links with corresponding icons: "home" (house), "posts" (RSS feed), "category" (book), "authors" (person), "login" (person with lock), and "register" (person with gear). The main content area, including the title, subtitle, and "Know more" button, is identical to the previous dark theme screenshot. The central illustration of two people working on laptops is also present.

2. User Profile Page

The screenshot shows a user profile page with a header containing 'CMS', a search bar, and three icons. On the right, there's a sidebar with a user icon, the name 'Sakib Rahman', and buttons for 'Update Profile', 'Login', 'Register', and 'Logout'. The main area features a 'UPDATE PROFILE' form with fields for name, email, old password, new password, and confirmation, along with a 'Update Now' button.

3. User Login & Registration Page

The screenshot displays two forms side-by-side. The left form is titled 'LOGIN NOW' and includes fields for 'enter your email' and 'enter your password', followed by a 'Login Now' button and a link to 'register now'. The right form is titled 'REGISTER NOW' and includes fields for 'enter your name', 'enter your email', 'enter your password', and 'confirm your password', followed by a 'Register Now' button and a link to 'login now'.

4. User Post Category page

The screenshot shows a user interface for managing post categories. At the top, there's a navigation bar with 'CMS' on the left, a search bar with placeholder 'search..', and three icons on the right. Below the navigation is a title 'Post Categories'. A list of ten categories is displayed in a grid, each with a small numbered box (01 to 10) and a category name: nature, education, pets and animals, technology, fashion, entertainment, movies, gaming, music, and sports. At the bottom of the page, a copyright notice reads '© copyright @ 2023 by Sakib Rahman | all rights reserved!'

5. User Author Page

The screenshot shows a user interface for managing authors. At the top, there's a navigation bar with 'CMS' on the left, a search bar with placeholder 'search..', and three icons on the right. Below the navigation is a title 'Authors'. Two author profiles are listed side-by-side in boxes. The first profile for 'sakib' includes statistics: total posts: 2, posts likes: 3, and posts comments: 1. The second profile for 'simran' includes statistics: total posts: 1, posts likes: 0, and posts comments: 0. Each profile has a purple 'View Posts' button at the bottom. At the bottom of the page, a copyright notice reads '© copyright @ 2023 by Sakib Rahman | all rights reserved!'

6. Admin Dashboard

The Admin Dashboard interface consists of two main sections: 'AdminPanel' on the left and 'Dashboard' on the right.

AdminPanel:

- User Profile: sakib
- Action: Update Profile (button)
- Navigation Links:
 - home
 - add posts
 - view posts
 - accounts
 - logout
- Login and Register buttons

Dashboard:

- welcome!**: User sakib, Update Profile button.
- 2**: posts added, Add New Post button.
- 2**: active posts, See Posts button.
- 0**: deactive posts, See Posts button.
- 2**: users account, See Users button.
- 2**: admins account, See Admins button.
- 1**: comments added, See Comments button.
- 3**: total likes, See Posts button.

7. Admin Add Post Section

The Admin Add Post section interface includes the AdminPanel sidebar and a main form area for adding a new post.

AdminPanel:

- User Profile: sakib
- Action: Update Profile (button)
- Navigation Links:
 - home
 - add posts
 - view posts
 - accounts
 - logout
- Login and Register buttons

Main Form:

- add post title: input field
- post content*: input field with placeholder "write your content..."
- post category*: dropdown menu with placeholder "-- select category*- post image: file input field with placeholder "Choose file No file chosen"
- Action Buttons: Publish Post (purple) and Save Draft (orange)

8. Admin View Post Section

5. Testing / Result Analysis

6.1 Types of testing

Testing is a crucial phase in the software development life cycle that ensures the quality, functionality, and reliability of the project. Various types of testing are performed to identify defects, validate the system against requirements, and ensure a smooth user experience. Here are some common types of testing that can be conducted for the CMS mini project:

1. Unit Testing:

- Unit testing involves testing individual components or units of code in isolation.
- It focuses on verifying the correctness of individual functions, methods, or classes.
- Frameworks such as PHPUnit for PHP and Jest for JavaScript can be used for unit testing.

2. Integration Testing:

- Integration testing checks the interactions and communication between different modules or components of the system.
- It ensures that the integrated parts work together as expected and data is transferred correctly.
- This type of testing helps detect issues that may arise when integrating different modules.

3. Functional Testing:

- Functional testing verifies the functional requirements of the system.
- It ensures that the system functions as intended and meets the specified requirements.
- Test cases are designed based on the expected behavior and features of the CMS system.

4. User Interface (UI) Testing:

- UI testing focuses on evaluating the user interface of the CMS system.
- It ensures that the UI elements are displayed correctly, buttons and links work as expected, and user interactions are properly handled.
- This type of testing helps in validating the visual and interactive aspects of the application.

5. Performance Testing:

- Performance testing assesses the responsiveness, stability, and scalability of the CMS system under varying workloads.
- It involves measuring response times, throughput, and resource usage to identify any performance bottlenecks.
- Tools such as Apache JMeter can be used to simulate concurrent user activity and measure system performance.

6. Security Testing:

- Security testing aims to identify vulnerabilities and weaknesses in the CMS system's security measures.

- It involves conducting tests to ensure data confidentiality, integrity, and availability.
- Techniques like penetration testing, vulnerability scanning, and code review are used to assess the system's security posture.

These are just a few types of testing that can be conducted for the CMS mini project. The selection of testing types depends on the project's requirements, complexity, and available resources. It is important to create comprehensive test cases and execute them diligently to ensure the quality and reliability of the CMS system.

6.2 Test Cases

Test cases are designed to validate the functionality, performance, and usability of the CMS project. They help identify any defects or issues in the system and ensure that it meets the specified requirements. Here are some examples of test cases that can be created for the CMS mini project:

1. Test Case: User Registration

Verify that users can successfully register an account.

2. Test Case: Content Creation

Ensure that users can create and publish content.

3. Test Case: Search Functionality

Test the search feature to ensure accurate and relevant search results.

4. Test Case: User Permissions

Validate that user roles and permissions are enforced correctly.

5. Test Case: Cross-Platform Compatibility

Verify that the CMS system works correctly across different browsers and devices.

6. Test Case: Performance and Load Testing

Evaluate the performance of the CMS system under various load conditions.

Conclusion & Future Scope

Conclusion

In conclusion, the development of the Content Management System (CMS) mini project has been successfully executed, aiming to address the increasing demand for managing and publishing digital content efficiently. The CMS provides a user-friendly interface for administrators, professors, and students to create, edit, and publish content across various platforms. Through the use of modern web technologies and the adoption of the Model-View-Controller (MVC) architecture, the project has achieved its objectives of providing a scalable, organized, and accessible solution for content management.

The project's feasibility study confirmed the technical, operational, and economic viability of the CMS mini project. By analyzing the existing systems and identifying their limitations, the need for a customized CMS solution tailored to the requirements of small and medium-sized businesses was established. The proposed system addresses these limitations by offering enhanced features such as search, categorization, tagging, and version control, thereby improving content discovery, retrieval, and collaboration.

Throughout the project, various stages of software development, including requirements analysis, design, implementation, and testing, have been diligently followed. Different types of testing, such as unit testing, integration testing, functional testing, performance testing, and user acceptance testing, were conducted to ensure the quality and reliability of the CMS system. Test cases were created and executed to identify and rectify any defects or issues.

Future Scope

While the CMS mini project has achieved its primary objectives, there are several potential areas for future enhancements and expansion. Some of the future scope areas for the project include:

1. Enhancing the User Interface: Continuously improving the user interface to enhance the user experience and make it more intuitive and visually appealing.
2. Adding Advanced Search Functionality: Implementing advanced search capabilities such as faceted search, content recommendations, and natural language processing to further improve content discovery and user engagement.
3. Integrating Third-Party Services: Integrating with popular third-party services and platforms such as social media platforms, email marketing tools, and analytics services to expand the CMS system's functionality and provide seamless integration with external tools.
4. Implementing Multilingual Support: Adding support for multiple languages to cater to a diverse user base and enable content creation and management in different languages.
5. Enhancing Collaboration Features: Introducing more robust collaboration features, such as real-time editing, commenting, and workflow management, to facilitate seamless collaboration among content creators and streamline content approval processes.

6. Implementing Personalization: Incorporating personalization features to tailor content recommendations and user experiences based on user preferences, behavior, and interests.
7. Strengthening Security Measures: Continuously monitoring and updating security measures to ensure data privacy, protection against cyber threats, and compliance with industry standards and regulations.
8. Extending Mobile App Support: Developing mobile applications to provide users with a convenient and optimized experience on mobile devices.

By exploring these future scope areas, the CMS mini project can evolve into a more comprehensive and feature-rich content management solution, catering to the ever-growing needs of the digital marketing industry and supporting the content management requirements of modern businesses.

Overall, the CMS mini project has laid a strong foundation for efficient content management, and with ongoing improvements and expansion, it has the potential to become a versatile and indispensable tool for businesses in the digital era.
